Survey Distribution Plan

With the final design of my survey complete I can now begin to devise a method of distribution. While initially it was my plan to print off many copies of the survey and have them distributed as a quick activity in my target audiences' lessons (year seven and year eight computing lessons), it has occurred to me that digitally distributing the survey may be the better plan.

While the older analogue method has its benefits, the primary limit is producing the number of surveys required (while I would have to go out of my way to have the ICT and computing department to allow me to distribute my survey in their lessons, I feel like this would not be too hard to get them to comply), as I have a limited number of documents I can print in term.

With this issue, the next best option would be to use a free online survey website. The one I have in mind is SurveyMonkey. The school has used this website before, they there is no worry of it being blocked on the school's server, this also means that students are familiar with the layout. Additional benefits are automatic collection of data, not having to worry about handwriting and the ability to distribute it via e-mail.
